# Pune Property Investor Website Documentation

Oct 2, 2026 · @Rushi

## Summary

The new site is a Next.js app that runs on your Mac and is not deployed yet. All of its data came from punepropertyinvestor.com, which was only read and never changed.

| Your question | Short answer |
| --- | --- |
| What is it built with? | Next.js 16, React 19 and TypeScript, styled with Tailwind CSS 4, with Radix UI for dialogs and accordions. Content sits in JSON files; there is no database. |
| How was it rebuilt? | One crawl of the old site on 1 Oct 2026, then scripts that turned each page into structured data, then a new design and build on top of that data. |
| Did you keep the old data as it is? | The facts are kept as published: prices, sizes, RERA numbers, possession dates. Names, stages and areas were tidied, one price and one URL were corrected, and 12 cover photos were changed. Some long text and about 140 images were not carried over. |
| Is the data correct? | It matches the old site: 1,758 of 1,785 values agree with the live pages today, and the rest are explained. The old site has its own errors, such as one RERA number on two projects, and those came across too. |
| How were the 188 projects counted? | The old site has no project list, so each of its 246 pages was sorted by type, and 188 are project pages. Three projects have two pages each, so there are about 182 to 185 distinct projects. |

| Your question | Short answer |
|---|---|
| Where do the images come from? | All 1,892 photos, plans and page images load from the old site's media library, and 111 video thumbnails from YouTube. Every link is in `audit/image-sources.csv`. |
| Is there a backend? | A small one inside the Next.js app: one enquiry endpoint, an image resizer and the compare page. No database, CMS, login or email. |
| How does "Book a consultation" work without a backend URL? | The form posts to that built-in endpoint. With no `LEAD_WEBHOOK_URL` set, it saves each enquiry to `data/leads.ndjson` on your Mac. Your test is there, and nobody was notified. |

## Tech stack

The site is a Next.js app written in TypeScript. It has no database and no CMS; all content sits in six JSON files in `data/`. Versions are the ones installed in `node_modules` on 2 Oct 2026.

| Layer | Technology | Version | Why it was chosen |
|---|---|---|---|
| Framework | Next.js (App Router, Turbopack) | 16.3.8 | Builds all 327 pages ahead of time; handles routing, page titles, redirects, the sitemap and image resizing |
| UI | React, React DOM | 19.3.0 | Content renders on the server; browser code runs only where people interact |
| Language | TypeScript, strict mode | 5.9.3 | Catches data and component errors before the build |
| Styling | Tailwind CSS, @tailwindcss/postcss | 4.3.3 | Colours, type and spacing are defined once in `app/globals.css`, with light and dark themes |

| Layer | Technology | Version | Why it was chosen |
|---|---|---|---|
| Accessible parts | Radix UI Dialog, Accordion, Slot | 1.1.23, 1.2.20, 1.3.3 | Keyboard support, focus handling and screen-reader labels for the enquiry dialog, menu, gallery and FAQs |
| Component helpers | class-variance-authority, clsx, tailwind-merge | 0.7.1, 2.1.1, 3.7.0 | Button variants and class merging, the same pattern shadcn/ui uses |
| Icons | lucide-react | 0.468.0 | One consistent set of line icons |
| Forms | React Hook Form, Zod, @hookform/resolvers | 7.89.0, 4.6.5, 5.9.1 | One set of rules checks the enquiry form in the browser and again on the server |
| Fonts | Newsreader, Manrope through `next/font` | n/a | Downloaded at build time and served from the site itself, so pages make no Google Fonts request |
| Runtime | Node.js | 20.19.4 | Runs the build and the server |

The components follow the shadcn/ui approach: Radix primitives wrapped and styled by hand. The shadcn command-line tool was not used, so there is no `components.json`.

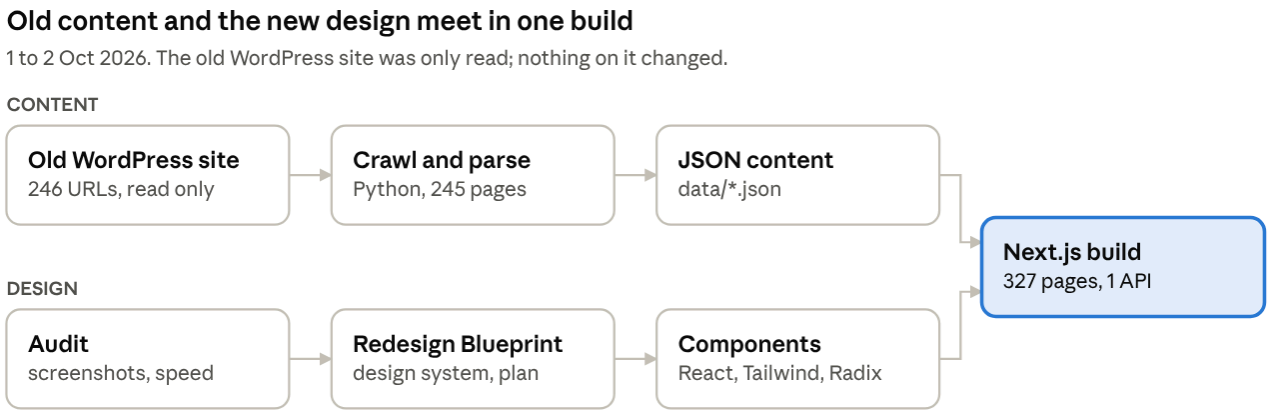

The code is 57 TypeScript and CSS files, about 2,600 lines, in `app/`, `components/` and `lib/`.

**Used only for the migration, not part of the site.** Python 3.14 with BeautifulSoup 4.15 and lxml 6.1 to crawl and parse the old pages, and Pillow 12.3 to measure image sizes. Headless Chrome through puppeteer-core 23 took screenshots, and Lighthouse 12 measured the old site's speed.

**Not used.** A database, a CMS, user accounts, analytics, an email service, a state-management library or an animation library.

## How the site was rebuilt

The rebuild ran on 1 and 2 Oct 2026 in two streams that meet in one build: content taken from the old site, and a new design from the Redesign Blueprint.

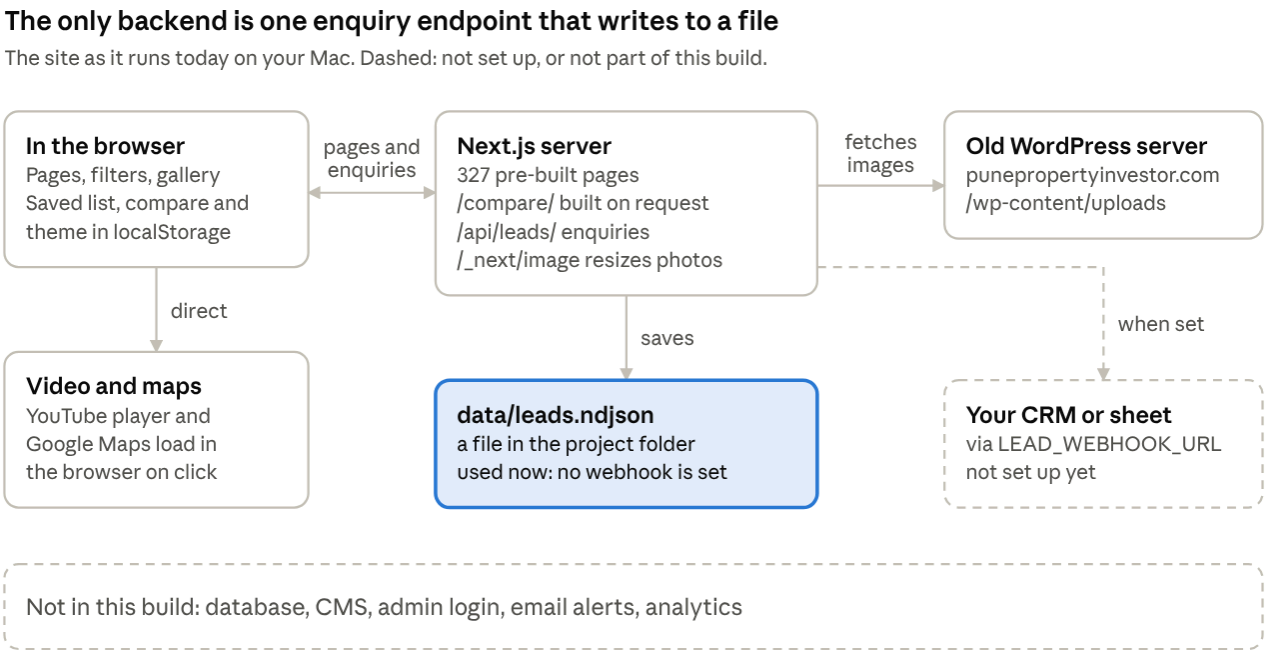

rebuild pipeline · 1 to 2 Oct 2026

1. **Audit.** The sitemaps were read, 245 of the 246 URLs fetched, and every page's title, headings, links, forms and structured data parsed. Screenshots were taken at 1,440 px and 390 px wide, and speed was measured with Lighthouse. The findings went into the Redesign Blueprint doc.
2. **Extract.** Python scripts turned each project page into a structured record, handling both page layouts the old site uses. Articles, videos, area intros and other pages went into the JSON files in `data/` the same way.
3. **Clean.** Developer names and stages were made consistent, areas were set from URLs or map pins, dead image links were removed, and sharper covers were chosen where a project had them.
4. **Build.** Next.js pages and shared components follow the blueprint's design system, and every old URL is kept or redirected.
5. **Your change requests.** A new colour palette, a dark theme with a toggle, the five-photo hero, and a fix for Dark Reader warnings in development.
6. **Checks.** The type check and the production build pass. Every old URL, the redirects, the sitemap and the enquiry endpoint were tested, and pages were screenshotted at desktop and phone widths. Not done yet: Lighthouse on the new site, automated tests, and testing on real devices.

## Backend and how enquiries work

The site has a small backend inside the Next.js app itself: one enquiry endpoint, an image resizer and the compare page. There is no database, CMS, admin login or email service.

architecture · as it runs on localhost, 2 Oct 2026

## What happens when someone books a consultation

1. "Book a consultation", "Get price details", "Schedule a visit" and "Download brochure" all open the same form, each with its own purpose.
2. The browser checks the name, a valid 10-digit mobile number and the consent box before sending.
3. The form sends the details to `/api/leads/`, the site's own endpoint in `app/api/leads/route.ts`. That is why it works without a backend URL: the backend is part of the same Next.js app that serves the pages.
4. The endpoint checks the fields again, and quietly drops any submission that fills in a hidden field only bots see.
5. If `LEAD_WEBHOOK_URL` is set, it forwards the enquiry there: a CRM, a Google Sheet or Zapier. It is not set, so the endpoint appends the enquiry as one line to `data/leads.ndjson` in the project folder.
6. The endpoint replies "ok" and the form shows the thank-you message.

Your test is in that file: Pundalik Desai, "Talk to an advisor", sent from the About page at 09:26 IST on 2 Oct 2026. Nobody was notified, so the message "An advisor will call you shortly" promises a call nobody knows about.

The Call and WhatsApp buttons do not use the backend. They open the phone dialler, or WhatsApp with +91 99709 91999.

| Part | Where it runs | What it does |
|---|---|---|
| 327 pre-built pages | Next.js server | Sent as ready HTML; nothing is computed per visit |
| `/compare/` | Next.js server, per request | Builds the table for the projects named in its link |
| `/api/leads/` | Next.js server | Receives enquiries, as above |
| `/_next/image` | Next.js server | Fetches photos and video thumbnails, resizes and caches them |
| Saved homes, compare list, theme | The visitor's browser (localStorage) | Stays on that device; nothing is sent anywhere |
| YouTube player and Google Maps | Their own servers | Load only after a click |

**Before launch**

- Set `LEAD_WEBHOOK_URL`, or enquiries pile up in a file on the server that nobody reads.
- Serverless hosts such as Vercel cannot write files. Without a webhook, every enquiry there would fail, and visitors would see "That did not go through".
- The file holds names and phone numbers in plain text; a CRM is the right home for them.
- There is no spam protection beyond the hidden field (no rate limit or CAPTCHA), and no email alert to your team.

## The data: source, count and accuracy

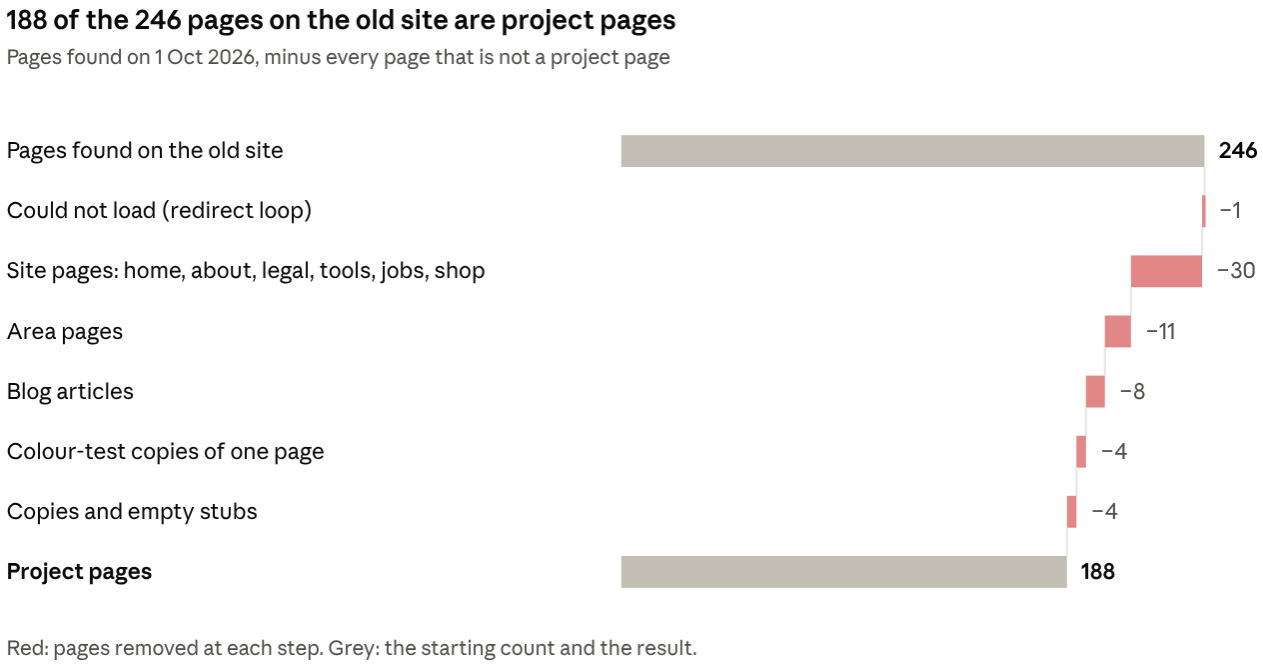

All the data came from punepropertyinvestor.com and was copied by scripts, not typed by hand. A re-check of all 188 project pages against the live site on 2 Oct 2026 matched 1,758 of 1,785 stored values.

### Where it came from

- **Which pages:** the site's own sitemaps (sitemap index: 223 pages and 8 posts), plus 15 live pages missing from the sitemap that were found through links inside other pages. 246 URLs in total.
- **How:** the HTML of each page, fetched once on 1 Oct 2026, six requests at a time. The site's robots.txt allows this; it blocks only `/wp-admin/`.

- **Project facts:** each project page's spec grid, configuration cards and headline price; the product data the old pages add for Google (developer, cover image, summary); the Google Maps pin; the YouTube embed; and the images.
- **Articles and videos:** the 8 blog posts, their dates from the blog index, and the 21 videos from the video gallery's playlist settings.
- **No database to export:** the WordPress REST API shows no property type. Every project is an ordinary page built in Elementor, so every page had to be read.

## How the 188 projects were counted

crawl of punepropertyinvestor.com · 1 Oct 2026 · 246 URLs

The old site keeps no list of projects, so every URL was sorted by what it is. Site pages were recognised by name, including the shop, cart and login pages an old plugin left behind. Area pages start with `2-bhk-flats-in-` (plus Koregaon Park), and articles come from the post sitemap. What remains are project pages, and their content confirms it: 123 use the newer spec grid, 60 the older price list and 5 other layouts.

188 counts pages, not distinct projects. Three projects have two pages each: Riverdale Grand ( `/riverdale-grand-kharadi/` and `/duville-riverdale-grand-kharadi/` ), Adani Atelier Greens ( `/adani-atelier-greens/` and `/adani-reality/` ) and Mantra 29 Gold Coast ( `/mantra-29-gold-coast-dhanori-tingre-nagar/` and `/29-gold-goast/` ). A few more look like copies: Dreams Icon shares a RERA number and 14 photos with the Adani pages, and Mind Space shares photos with Aaiji Crystal. The distinct count is about 182 to 185, so the home page line "We compare 188 projects" overstates it slightly until the duplicates are merged.

## How accurate it is

Each stored value was compared with what the live page shows next to the same label today. 187 of the 188 pages are unchanged since the crawl; Triaa Vasantam City Center has a new layout.

| Field | Compared | Match | What did not match |
|---|---|---|---|
| Headline price | 123 | 122 | Pristine O2 World: the page says ₹1.11 Lakhs, the data says ₹1.11 Cr (a deliberate correction) |
| Configuration prices | 350 | 349 | Belmont Skyverse's "₹61 – 72 Lakhs" is stored as 72 for sorting; the text shown is correct |
| Price on older pages | 35 | 35 | |
| RERA number | 122 | 120 | False alarms: Codename Light shows "Request Rera No", and Goodwill Breeza puts "Phase 1" before its number |
| Stage | 122 | 122 | |
| Target possession | 124 | 124 | |
| RERA possession | 122 | 115 | 7 pages say "Ready"; the parser read only dates |
| Litigation | 122 | 122 | |
| Land parcel | 173 | 172 | Pride World City's "400 Acres+" was missed |
| Towers | 186 | 185 | Pride World City's "18+" was missed |
| Floors | 184 | 170 | 14 values such as "B+G+14/15" were missed |
| Carpet area | 122 | 122 | 7 leave out the word "onwards" |

This shows the data matches what the old site says. It does not show the old site is right, and the old site's own errors came across:

- The same RERA number appears on two or three different projects 8 times, across 17 pages. For example, Mindspace Residency (Lohegaon) and Evana Homes (Manjari) share P52100076913. These need checking on MahaRERA.
- Pages contradict themselves. Kumar Magnacity shows ₹79 L in its headline, ₹78 L in its table, ₹75 L in its text and ₹72.99 L in its video thumbnail. Lodha Giardino lists 11 acres and 7 towers in its specs, and 14 acres and 8 towers in its text.
- Galleries reuse photos from unrelated projects (see Images).

- Some facts are not on the page at all: 62 projects have no RERA number, 30 no price and 56 no developer.

## What was kept and what changed

### Kept as published

| Content | Note |
|---|---|
| Project facts | Name, prices, configurations, carpet areas, RERA number, land parcel, towers, floors, stage, possession dates and litigation. Prices are also stored as numbers for the filters |
| Project summaries | Taken from the old pages' product data for Google. 30 were placeholders such as "Description"; for those the site writes one sentence from the facts |
| 8 articles | Text and images; comment forms and share buttons removed |
| 21 videos | Titles, lengths and area groups; 18 now link to their project page |
| Other pages | Privacy, terms, careers, 2 job pages, media, awards and Koregaon Park: text and images, in a simpler layout |
| Contact details | Phone numbers, WhatsApp, email, address, branches, and the company name in the consent text |

### Changed or corrected

| What | Change |
|---|---|
| Developer names | Made consistent, for example "Godrej Properties Limited" to "Godrej Properties". 5 pages that named Pune Property Investor as the developer now show none |
| Stage | 10 spellings such as "Mid Stage", "Mid-Stage" and "Last Stage" map to 3 filters; the page still shows the original words |

| What | Change |
|---|---|
| Area | Taken from the URL. 42 older URLs name no area: 40 were placed by their map pin (the nearest area within 6 km), and 2 are too far from any area to place |
| Pristine O2 World | Price "₹1.11 Lakhs" corrected to ₹1.11 Cr |
| Mantra 29 Gold Coast | URL typo `gold-cost` fixed; the old URL redirects |
| Page titles | 41 default titles rewritten as "Name Area Pune \| Price, Floor Plans & Brochure" |
| Images | 12 covers changed and 24 dead links removed (see Images) |
| Reviews | 3 shortened (Jagan Nagulkar, Kishor Shinde, Jay Dev); the 3 from business partners are labelled as such |
| Article categories | All were "Uncategorized"; now Area guides, Market insights and Basics |

**Newly written.** The home page, the About page (rewritten from the old About text, without its repeated paragraph and construction-site boilerplate), the Services page, each project's FAQs and "Before you book" checks (generated from its facts), the area statistics, and the two calculators (rebuilt with the same inputs).

**Not carried over**

- The 500-word article on each newer project page.
- The area pages' long copy. Only the first sentence of each intro is used; the "location benefits", "price trends" and "why invest" sections are not.
- The luxury page's FAQs, reviews and area blurbs.
- Amenity names (the amenity photos are kept as gallery photos), and the "Details" boxes under each video playlist.
- The official PPI logo, the 14 developer logos and the HR phone number.
- Some claims: 9,00,000 sq ft sold (the About page said 12,00,000), 0% brokerage, and "only 3 mighty years" and "only 2 mighty years". Kept, and still to confirm: 20,000+ clients, 10,000+ site visits and 200+ team.
- 21 junk pages, and 2 project pages that loop on the old site (Goodwill Elements, 31 Palma Drive).
- About 140 images that were skipped by mistake (see Images).

# Images

Every photo, floor plan and article image on the new site loads from the old site's WordPress media library at `punepropertyinvestor.com/wp-content/uploads/`, and video thumbnails load from YouTube. No image was bought, generated or copied into the project. The full list of links, one row per use, is in `audit/image-sources.csv`.

| Source | What it supplies | Unique links |
|---|---|---|
| `https://punepropertyinvestor.com/wp-content/uploads/…` | Project covers, photos, floor plans and master plans; the 5 hero photos; article and page images | 1,892 |
| `https://i.ytimg.com/vi/<video id>/hqdefault.jpg` | Video thumbnails | 111 |
| Drawn in code | The logo mark (`components/layout/header.tsx`) and the tab icon (`app/icon.svg`) | n/a |

By where they appear: 182 covers, 1,102 photos, 503 floor plans, 23 master plans, 111 video thumbnails, 81 images on the awards, media and careers pages, 13 article images and 5 hero photos. Some links appear in more than one place, so these add up to more than 2,003. When a page shows a photo, the Next.js server fetches the original from the old site, resizes it, converts it to WebP or AVIF and caches the copy.

The CSV columns are `page_on_new_site`, `role`, `project_or_article`, `image_url`, `source_host`, `width_px`, `height_px` and `http_status`.

## How the images were chosen

1. Every image inside the main content of each project page was collected, including lazy-loaded ones.
2. WordPress size suffixes such as `-300x212` were removed, so each link points to the full-size original.
3. Images in the old floor plan and master plan tabs were filed as plans; the rest as photos.
4. Files with logo, icon, spinner, placeholder, WhatsApp, svg, PPI, brochure_page, avatar or flag in their names were skipped, to drop logos and icons.
5. The cover is the image the old page declares in its product data for Google; otherwise the first photo.
6. Each project keeps up to 14 photos, 8 floor plans and 3 master plans.

7. Every link was checked. 24 dead links were removed, and 2,002 of the 2,003 links in use load today.
8. Image sizes were measured, and 12 covers were changed (table below).
9. The 5 hero photos were picked from the measured images 1,600 px or wider.

### Hero photos

| Project | Link | Size (px) |
|---|---|---|
| Pride Purple Codename, Kharadi | https://punepropertyinvestor.com/wp-content/uploads/2026/03/Pride-purple-codename-real-kharadi.webp | 1920 × 1096 |
| Dosti Greenscapes, Hadapsar | https://punepropertyinvestor.com/wp-content/uploads/2025/07/unnamed.webp | 3840 × 2160 |
| Riverdale Grove, Kharadi | https://punepropertyinvestor.com/wp-content/uploads/2023/12/unnamed-1-1-scaled.webp | 2560 × 1440 |
| Mantra 29 Gold Coast, Dhanori | https://punepropertyinvestor.com/wp-content/uploads/2024/03/5osDaUATLAcYmV6yvx5NJYyX8L7pn6.webp | 1921 × 1044 |
| Kanchan Osian Almanova, Mundhwa | https://punepropertyinvestor.com/wp-content/uploads/2025/05/Cam14_Building-elevation-2048x1257-1.jpg | 1600 × 982 |

### Cover photos that were changed

| Project | Old cover | New cover | Reason |
|---|---|---|---|
| Riverdale Grove | `unnamed-5-1.webp` | 2560 px photo | Larger photo of the same project |
| VTP Aurelia | `b2-1400w-1.webp` | 1400 px photo | Larger photo of the same project |
| Unique Envogue | `elevationwebp.webp` | 1500 px render | Larger photo of the same project |
| Gini Belvista | 480 px | 1600 px | Sharper |
| 29 Gold Goast | 756 px | 1921 px | Sharper |
| Prince Town Tower | 270 px thumbnail | 1600 px | Sharper |

| Project | Old cover | New cover | Reason |
|---|---|---|---|
| Mahindra IvyLush | Pride Purple Codename's photo | Own elevation, 687 px | The old page showed another project's photo |
| Unique Youtopia | Brochure page, 1600 px | Project photo, 800 px | Brochure page replaced with a photo |
| Laxmi Emerald | Brochure page, 1600 px | Project photo, 650 px | Brochure page replaced with a photo |
| Bramha The Collection | Generic image, 1465 px | Own photo, 628 px | The old cover also appears on 5 other projects |
| Space Paramount Tower | Tall night view, 1600 px | Landscape view, 1000 px | A tall image crops badly in a wide card |
| Shreeram Properties | Office building, 1430 px | Residential render, 692 px | The old cover showed an office building |

The old sizes of the first three were not measured. Five of the twelve swap a larger image for a smaller one, so those covers look softer.

## Known issues

- **Linked to the old server.** All 1,892 images still load from the old WordPress server. If that server goes offline or its media library is cleared, the new site loses its photos. Copy them to your own storage, such as an S3 bucket or Cloudinary, before switching WordPress off.
- **Skipped by mistake.** The file-name filter in step 4 also caught real content: 93 images named WhatsApp-Image-… (34 floor plans, 59 photos), 3 renders named …-without-logo, 1 Dreams Icon photo, and 10 floor plans saved as brochure pages. So 10 projects show no floor plans: Kumar Magnacity, Kumar Goldmine Sapphire, Gera Island of Joy, Gera Avive Towers, Majestique Tower, Joyville Celestia, Aaiji Crystal, Mind Space, Zen Elite and Sukhwani Verde.
- **Over the limits.** Step 6 left out 46 photos and 21 floor plans.
- **Copied on the old site.** Many galleries reuse photos from unrelated projects. For example, Adani Atelier Greens, Adani Reality and Bramha The Collection share 16 identical images. They were carried over as they are.
- **Soft photos.** 74 of the 177 measured covers are under 1,100 px wide. They need the original renders from the developers.

- **One dead thumbnail.** First 32's video thumbnail returns 404; the video was probably removed from YouTube.
- **Logos.** The official PPI logo file is not used; the header shows a placeholder mark drawn in code. The 14 developer logos from the old home page are not used either; developers appear by name.

## URLs and SEO

Every old address that had real content still works. On 2 Oct 2026 all 245 URLs that loaded on the old site were requested from the new build: 219 load at the same address, 1 redirects to its corrected spelling, 23 return 404 on purpose, and 2 depend on letter case (below).

| Result | Count | Examples |
|---|---|---|
| Same address, loads | 219 | `/kumar-magnacity-hadapsar/`, `/2-bhk-flats-in-kharadi/`, `/why-invest-in-kharadi/`, `/about-us/` |
| Redirects | 1 | `/mantra-29-gold-cost-dhanori-tingre-nagar/` to `/mantra-29-gold-coast-dhanori-tingre-nagar/` |
| Retired, returns 404 | 23 | Shop, cart, checkout, 2 account pages, login, registration, lost password, search results, demo home, events, news, location, 4 colour tests, 2 copy pages, `gera-island-of-joy-2`, `vtp-pegasus`, `enquire-now`, `thank-you` |
| Capital-letter duplicates | 2 | `/2-bhk-flats-in-Dhanori/`, `/2-bhk-flats-in-Charholi/` |

Old links found inside pages and in the footer redirect too, through 27 rules in `next.config.ts`. They cover 11 old short project slugs (for example `/mantra-magnus/`), the Mantra 29 typo, the old calculator URL, 4 renamed pages (`/blog/`, `/contact/`, `/career/`, `/awards-and-recognition/`), 7 footer area shortcuts and the 3 `/2-3-bhk-flats-in-…` canonical targets. One of the footer shortcuts, `/mundhwa/`, returns 404 on the old site. Matching ignores letter case, so `/Blog/` works as well.

Three old addresses were not migrated. `/goodwill-elements-lohegaon/` and `/31-palma-drive-upper-kharadi/` redirect to each other forever on the old site. `/pristine-tranquil-garden/` is a 404 there too.

**Letter case.** The old Dhanori page named `/2-bhk-flats-in-Dhanori/` (capital D) as its canonical address, so Google may list it that way. The capital-letter Dhanori and Charholi addresses are not redirected. On your Mac they sometimes load, because macOS ignores letter case in file names; on a Linux server they will return 404. The fix belongs in a Next.js proxy (middleware), because a plain redirect rule ignores case and would loop back to itself.

**SEO setup.** Titles and descriptions come from the old pages, except 41 default titles and 30 placeholder descriptions, which were rewritten. Every page declares a canonical address with a trailing slash. The sitemap lists 312 URLs, and robots.txt blocks `/api/`. Pages carry structured data for Google: RealEstateAgent, RealEstateListing, FAQPage, Article and BreadcrumbList.

## Project files

The project is the `InvestorProperty Website` folder on your Desktop. Its name ends with a space, so quote the path in terminal commands.

```
app/             pages and routes; app/api/leads/route.ts receives enquiries
components/      ui, layout, lead, property, location, blog, media, tools,
home
lib/             types.ts (data model), data.ts (loads the JSON), areas.ts,
content.ts, site.ts
data/            properties.json, posts.json, videos.json, pages.json,
hubs.json, hero.json
audit/           url-inventory.csv (old site), image-sources.csv (every image
link)
scripts/         crawl.py, extract.py, properties.py, build_data.py,
pick_covers.py
next.config.ts   redirects and image settings
README.md        setup and launch checklist
```

| Task | Command or file |
|---|---|
| Install | `npm install` |
| Run while editing | `npm run dev`, then open http://localhost:3000 |
| Production build | `npm run build`, then `npm start` |
| Type check | `npm run typecheck` |
| Change a price, RERA number or photo | Edit that project in `data/properties.json`, then rebuild |

| Task | Command or file |
| --- | --- |
| Change phone, WhatsApp or address | `lib/site.ts` |
| Change colours or fonts | `app/globals.css` (light and dark values) and `app/layout.tsx` |
| Change the hero photos | `data/hero.json` |
| Send enquiries to a CRM | Set `LEAD_WEBHOOK_URL` in `.env.local` (template in `.env.example`) |

The scripts record the one-time migration; they are not a push-button pipeline. The raw crawl (the HTML of 245 pages) is not stored in the project, and three steps ran as one-off commands: placing projects by map pin, removing dead image links, and the Mantra 29 URL fix. Refreshing the data from the old site needs those steps added to the scripts first.

## Open items

These have to happen before the site goes live. The first three are the most urgent.

- [ ] Set `LEAD_WEBHOOK_URL` to your CRM, a Google Sheet or a WhatsApp automation. Until then enquiries reach only `data/leads.ndjson`.
- [ ] Copy the 1,892 images from the old WordPress server to your own storage before switching WordPress off.
- [ ] Fix the image file-name filter. This restores floor plans for 10 projects and about 140 other images.
- [ ] Decide which duplicate project pages to merge, then correct the "188 projects" line on the home page.
- [ ] Check the 8 RERA numbers that appear on more than one project on MahaRERA, and correct the pages.
- [ ] Add a redirect for the capital-letter Dhanori and Charholi addresses before deploying to a Linux server.
- [ ] Replace the placeholder logo with the official PPI logo.
- [ ] Confirm the statistics (20,000+ clients, 10,000+ site visits, 200+ team), the primary phone number and the ₹2 Cr luxury threshold.
- [ ] Supply the missing data: 62 RERA numbers, 30 prices and 56 developers. Also add the 14 floor counts and 7 "Ready" RERA possession values the parser missed.
- [ ] Bring over the area pages' long copy and the luxury page FAQs, or accept the SEO risk of dropping them.
- [ ] Add analytics, with a consent banner.

- [ ] Choose hosting, then run Lighthouse and real-device tests on the new site.
